Diffusion Mass Transfer
Lecture – 03
Fick's First and Second Law

Welcome to the third lecture on Mass Transfer Operation. Before going to the next lecture let us have small recap on our earlier lecture. In the last lecture we have discussed the molecular diffusion as well as eddy diffusion and the effect of different parameters on the rate of molecular diffusion.

(Refer Slide Time: 01:05)

So, we have discussed molecular diffusion and Eddy diffusion. We have considered the effect of barriers on molecular Diffusion. Then we have discussed the different concentration terms which are used in the discussion of the diffusion mass transfer concentrations. We have discussed the diffusion velocities and we have discussed the fluxes and the relations between the different Fluxes. In this lecture we will discuss Fick's law of molecular diffusion.

(Refer Slide Time: 03:07)

Fick's Law of Molecular Diffusion

Fick's first law defines:

The diffusion flux of a component A in an isothermal, isobaric binary system is proportional to the concentration gradient in a particular direction.

Adolf Eugen Fick
(1829-1901)
- A German physiologist

The Fick's who is Adolf Eugen Fick a German physiologist he has given a law for the diffusion of components and Fick's law is divided into two laws. One is Fick's first law and the second one is Fick's second law the Fick's first law defines the diffusion flux of a component A in an isothermal, isobaric binary system is proportional to the concentration gradient in a particular direction.

(Refer Slide Time: 04:03)

Fick's Law of Molecular Diffusion

For diffusion of component A only in the 'x' direction is

$J_{A,x} = -D_{AB} \frac{dc_A}{dx}$

$J_{A,x}$ = molar flux of component A in the 'x' direction.

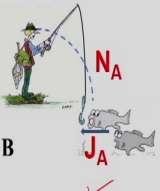

✓ It has units of $\frac{\text{amount of material diffused}}{(l^2)(t)}$

Diffusion occurs in decreasing conc.

C_A = Concentration of A x = distance of diffusion

D_{AB} = the diffusion coefficient or diffusivity of component A in B

✓ It has units of $\frac{l^2}{t}$

So, we can consider a diffusion of component A only in x direction this can be represented by J_A which is equal to minus $D_{AB} \frac{dc_A}{dx}$ here $J_{A,x}$ is the molar flux of

component A in the x direction. It has units of amount of material diffused per unit area per unit time. So, the amount of material which is diffused may be kg of material diffused or the kilo mole of material diffused per meter square area which is the cross sectional area and per unit time.

C_A over here is the concentration terms which is concentration of a and the x is the distance of diffusion D_{AB} over here is the diffusion coefficient or the diffusivity of component A in B. it is called binary diffusion coefficient of component A in B. The unit of diffusion coefficient is length square per time that is meter square per second. The negative term introduced over here is due to the diffusion occurs in decreasing concentrations. And in earlier lectures we have discussed the relation between J_A and N_A which is shown over here and we will consider this relation and we discuss the relation between the mutual diffusivities of component A and B.

(Refer Slide Time: 06:09)

Relation between Mutual Diffusivity of species A and B

➤ Show that for a binary mixture A and B, the mutual diffusivities are same, i.e. $D_{AB} = D_{BA}$

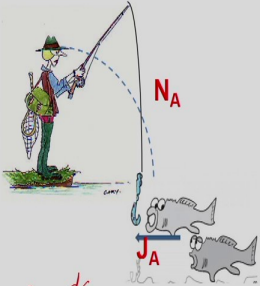

Solution

We know that

$$N_A = J_A + \frac{C_A}{C} N$$

For gas mixture

$$\frac{C_A}{C} = y_A \Rightarrow \frac{dC_A}{dx} = C \frac{dy_A}{dx} \quad J_A = -D_{AB} \frac{dC_A}{dx}$$

$$N_A = -D_{AB} \frac{dC_A}{dx} + y_A N = -CD_{AB} \frac{dy_A}{dx} + y_A N$$

So, the questions over here is we need to show that for a binary mixture A and B the mutual diffusivities are same that is D_{AB} is equal to D_{BA} ; how to solve it? So, we know that the relations between N_A and J_A . So, N_A is equal to J_A plus C_A by N into N for gas mixture C_A by C is equal to y_A it is the mole fraction in the gas phase. So, we can write N_A is equal to minus $D_{AB} \frac{dC_A}{dx}$ since J_A is equal to minus $D_{AB} \frac{dC_A}{dx}$.

So, we can write N_A is equal to $-CD_{AB} \frac{dy_B}{dx} + y_B N$. Now, if we differentiate this equations we can write $dC_A dx$ would be equal to C into $dy_A dx$. So, if we substitute $dC_A dx$ over here we will obtain $-CD_{AB} \frac{dy_A}{dx} + y_A N$.

(Refer Slide Time: 08:03)

Relation between Mutual Diffusivity of species A and B

Similarly: $N_B = -CD_{BA} \frac{dy_B}{dx} + y_B N$ ✓

- Summing up the above two equations:

$$N_A + N_B = -CD_{AB} \frac{dy_A}{dx} + y_A N - CD_{BA} \frac{dy_B}{dx} + y_B N$$

$$= -CD_{AB} \frac{dy_A}{dx} - CD_{BA} \frac{dy_B}{dx} + (y_A + y_B)N$$
- Since for two component:

$$N_A + N_B = N$$

$$y_A + y_B = 1$$
 ✓

$$\frac{dy_A}{dx} + \frac{dy_B}{dx} = 0$$
 so, $\frac{dy_A}{dx} = -\frac{dy_B}{dx}$ ✓

$N = -CD_{AB} \frac{dy_A}{dx} + CD_{BA} \frac{dy_A}{dx} + 1 \times N$
→
Hence, $D_{AB} = D_{BA}$ (proved)

Similarly, for component B we can write N_B is equal to $-CD_{BA} \frac{dy_B}{dx} + y_B N$. So, if we add this two equations N_A and N_B together we can get $N_A + N_B$ is equal to $-CD_{AB} \frac{dy_A}{dx} + y_A N - CD_{BA} \frac{dy_B}{dx} + y_B N$. Now, if we just rearrange these equations we can get $-CD_{AB} \frac{dy_A}{dx} - CD_{BA} \frac{dy_B}{dx} + y_A + y_B$ into N as for two component mixture $N_A + N_B$ is equal to N its a total mole and $y_A + y_B$ is equal to one. The total mole fractions would be one for binary systems from here if we just differentiate this equation we will get $\frac{dy_A}{dx} + \frac{dy_B}{dx} = 0$. And we can write $\frac{dy_A}{dx}$ would be equal to $-\frac{dy_B}{dx}$. If we substitute this relations in the above relation we can get N_A is equal to $-CD_{AB} \frac{dy_A}{dx} + CD_{BA} \frac{dy_A}{dx} + 1 \times N$. So, from here we can see that D_{AB} is equal to D_{BA} , that is the mutual diffusivity of component A and component B are same.

(Refer Slide Time: 10:13)

Unsteady State Diffusion

- The change of concentration of a component of the diffusive constituents in a mixture over a time is unsteady state of diffusion.

Balance Equation:

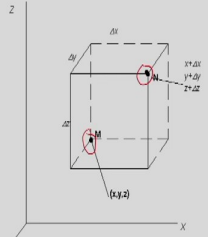

In + Generation = out + accumulation ✓

Mass Flow rate of component A In

$$= M_A \left[N_{A,x} \Big|_x \Delta y \Delta z + N_{A,y} \Big|_y \Delta x \Delta z + N_{A,z} \Big|_z \Delta x \Delta y \right]$$

Where,

- $N_{A,x}$ = flux in the x direction
- $N_{A,x} \Big|_x$ = value of flux at location x
- M_A = molecular weight of A

Now, let us consider unsteady state diffusion in this case let us consider at point M which is x y z and point N which is y plus delta x y plus delta y and z plus delta z. Now the change of concentration of a component of the diffusive constituents in a mixture over a time is unsteady state of diffusion.

The balance equations if we write for these is in plus generation is equal to out plus accumulation, the mass flow rate of component a in to this to the point at x y and z. We can write M A into N A x at point x delta y delta x plus N A y at x delta x delta z plus N A z at x delta x delta y where N A x is the flux in the x direction N A x at x is the value of flux at location x and M A is the molecular weight of component A.

(Refer Slide Time: 11:49)

Unsteady State Diffusion

Generation of A by Chemical Reaction:

Let the rate of reaction = $R_A \left(\frac{\text{mol}}{\text{volume} \times \text{time}} \right)$ ✓

- Rate of generation or production = $M_A R_A \Delta x \Delta y \Delta z$
- Mass rate of flow out = $M_A \left[N_{A,x} \Big|_{x+\Delta x} \Delta y \Delta z + N_{A,y} \Big|_{y+\Delta y} \Delta x \Delta z + N_{A,z} \Big|_{z+\Delta z} \Delta x \Delta y \right]$

Generation of A by chemical reactions we can write let the rate of reactions is equal to R_A which is mole per unit volume into time. Now rate of generation or production would be equal to $M_A R_A$ into $\Delta x \Delta y \Delta z$. R_A is the rate of reactions M_A is the molecular weight of the component A.

(Refer Slide Time: 12:51)

Unsteady State Diffusion

Generation of A by Chemical Reaction:

Let the rate of reaction = $R_A \left(\frac{\text{mol}}{\text{volume} \times \text{time}} \right)$ ✓

- Rate of generation or production = $M_A R_A \Delta x \Delta y \Delta z$
- Mass rate of flow out = $M_A \left[N_{A,x} \Big|_{x+\Delta x} \Delta y \Delta z + N_{A,y} \Big|_{y+\Delta y} \Delta x \Delta z + N_{A,z} \Big|_{z+\Delta z} \Delta x \Delta y \right]$
- Rate of Accumulation = $\Delta x \Delta y \Delta z \frac{\partial \rho_A}{\partial t}$
 ρ_A = density of A

So, the mass flow rate out we can write $M_A N_{A,x}$ at x plus Δx into $\Delta y \Delta z$. The rate of flow out can be written as $M_A N_{A,x}$ at x plus $\Delta x \Delta y \Delta z$ plus $N_{A,y}$ at x plus Δx into $\Delta x \Delta z$ plus $N_{A,z}$ at x plus Δx into $\Delta x \Delta y$ the

rate of accumulation is $\Delta x \Delta y \Delta z \frac{\partial \rho_A}{\partial t}$ where ρ_A is the density of component A.

(Refer Slide Time: 14:15)

Unsteady State Diffusion

So,
In + Generation = out + accumulation

$$\begin{aligned} \rightarrow M_A [N_{A,x}|_x \Delta y \Delta z + N_{A,y}|_y \Delta x \Delta z + N_{A,z}|_z \Delta x \Delta y] + M_A R_A \Delta x \Delta y \Delta z \\ = M_A [N_{A,x}|_{x+\Delta x} \Delta y \Delta z + N_{A,y}|_{y+\Delta y} \Delta x \Delta z + N_{A,z}|_{z+\Delta z} \Delta x \Delta y] + \Delta x \Delta y \Delta z \frac{\partial \rho_A}{\partial t} \end{aligned}$$

$$\begin{aligned} \rightarrow M_A [(N_{A,x}|_{x+\Delta x} - N_{A,x}|_x) \Delta y \Delta z + (N_{A,y}|_{y+\Delta y} - N_{A,y}|_y) \Delta x \Delta z \\ + (N_{A,z}|_{z+\Delta z} - N_{A,z}|_z) \Delta x \Delta y] + \Delta x \Delta y \Delta z \frac{\partial \rho_A}{\partial t} = M_A R_A \Delta x \Delta y \Delta z \end{aligned}$$

Now divide both side by $\Delta x \Delta y \Delta z$ and taking $\Delta x \rightarrow 0$, $\Delta y \rightarrow 0$ and $\Delta z \rightarrow 0$

Now, we can write in the balanced equation in plus generation is equal to out plus accumulation. So, if we substitute it would be $M_A N_{A,x}$ at $x \Delta y \Delta z$ plus $N_{A,y}$ at $x \Delta x \Delta z$ plus $N_{A,z}$ at $x \Delta x \Delta y$ plus $M_A R_A \Delta x \Delta y \Delta z$. Which would be equal to $M_A N_{A,x}$ at $x + \Delta x$ plus $N_{A,y}$ at $x + \Delta x$ plus $N_{A,z}$ at $x + \Delta x$ plus $\Delta x \Delta y \Delta z \frac{\partial \rho_A}{\partial t} = M_A R_A \Delta x \Delta y \Delta z$.

Now, from this we can write M_A into $N_{A,x}$ at $x + \Delta x$ minus $N_{A,x}$ at x into $\Delta y \Delta z$ plus $N_{A,y}$ at $y + \Delta y$ minus $N_{A,y}$ at y into $\Delta x \Delta z$ plus $N_{A,z}$ at $z + \Delta z$ minus $N_{A,z}$ at z into $\Delta x \Delta y$ plus $\Delta x \Delta y \Delta z \frac{\partial \rho_A}{\partial t} = M_A R_A \Delta x \Delta y \Delta z$. Now, if we divide both sides by $\Delta x \Delta y \Delta z$ and taking the limit $\Delta x \rightarrow 0$, $\Delta y \rightarrow 0$ and $\Delta z \rightarrow 0$.

(Refer Slide Time: 16:37)

Unsteady State Diffusion

We have, $M_A [(N_{A,x}|_{y+dz} - N_{A,x}|_y) \Delta y \Delta z + (N_{A,y}|_{x+dx} - N_{A,y}|_x) \Delta x \Delta z + (N_{A,z}|_{z+dz} - N_{A,z}|_z) \Delta x \Delta y] + \Delta x \Delta y \Delta z \frac{\partial \rho_A}{\partial t} = M_A R_A \Delta x \Delta y \Delta z$

For Component A

$$M_A \left(\frac{\partial N_{A,x}}{\partial x} + \frac{\partial N_{A,y}}{\partial y} + \frac{\partial N_{A,z}}{\partial z} \right) + \frac{\partial \rho_A}{\partial t} = M_A R_A$$

For Component B

$$M_B \left(\frac{\partial N_{B,x}}{\partial x} + \frac{\partial N_{B,y}}{\partial y} + \frac{\partial N_{B,z}}{\partial z} \right) + \frac{\partial \rho_B}{\partial t} = M_B R_B$$

Total Material balance after adding (a) and (b)

$$M_A R_A + M_B R_B = \frac{\partial (M_A N_A + M_B N_B)_x}{\partial x} + \frac{\partial (M_A N_A + M_B N_B)_y}{\partial y} + \frac{\partial (M_A N_A + M_B N_B)_z}{\partial z} + \frac{\partial (\rho_A + \rho_B)}{\partial t}$$

We will get for component a $M_A \frac{\partial N_A}{\partial x} + \frac{\partial N_A}{\partial y} + \frac{\partial N_A}{\partial z} + \frac{\partial \rho_A}{\partial t} = M_A R_A$. Now for component B it will be $M_B \frac{\partial N_B}{\partial x} + \frac{\partial N_B}{\partial y} + \frac{\partial N_B}{\partial z} + \frac{\partial \rho_B}{\partial t} = M_B R_B$.

Now, if we add these two relations we will get $M_A R_A + M_B R_B$ would be equal to $\frac{\partial (M_A N_A + M_B N_B)_x}{\partial x} + \frac{\partial (M_A N_A + M_B N_B)_y}{\partial y} + \frac{\partial (M_A N_A + M_B N_B)_z}{\partial z} + \frac{\partial (\rho_A + \rho_B)}{\partial t}$.

(Refer Slide Time: 18:07)

Unsteady State Diffusion

Now,

$$\frac{\partial (M_A N_A + M_B N_B)_x}{\partial x} + \frac{\partial (M_A N_A + M_B N_B)_y}{\partial y} + \frac{\partial (M_A N_A + M_B N_B)_z}{\partial z} + \frac{\partial \rho}{\partial t} = 0$$

Where $\rho = \rho_A + \rho_B =$ solution density

$M_A R_A + M_B R_B = 0$

since mass rate of generation of A & B must equal zero

$$V_x = \frac{\rho_A v_{A,x} + \rho_B v_{B,x}}{\rho_A + \rho_B}$$

$$\rho V_x = \rho_A v_{A,x} + \rho_B v_{B,x}$$

$$\rho V_x = M_A C_A v_{A,x} + M_B C_B v_{B,x}$$

$$= M_A N_{A,x} + M_B N_{B,x}$$

$V_x =$ Mass average Velocity
 $v_{A,x} =$ Absolute Velocity
 $N_{A,x} =$ Molar Flux

Now, $\frac{\partial}{\partial x}(M_A N_A + M_B N_B) + \frac{\partial}{\partial y}(M_A N_A + M_B N_B) + \frac{\partial}{\partial z}(M_A N_A + M_B N_B) = \rho \frac{\partial V_x}{\partial x} + V_x \frac{\partial \rho}{\partial x} + \rho \frac{\partial V_y}{\partial y} + V_y \frac{\partial \rho}{\partial y} + \rho \frac{\partial V_z}{\partial z} + V_z \frac{\partial \rho}{\partial z} + \frac{d\rho}{dt}$. Now, the right hand side terms would be equal to 0 because where ρ is equal to $\rho_A + \rho_B$ is equal to the solution density and $M_A R_A + M_B R_B$ would be equal to 0. Since mass rate of generation of A and B must equal 0, that is why if we substitute this in the earlier equations. So, the right hand side term would be equal to 0.

Now, V_x we know is equal to $\frac{\rho_A V_{Ax} + \rho_B V_{Bx}}{\rho_A + \rho_B}$. Where V_x is the mass average velocity and small v_A is the absolute velocity. Now, if we just $\rho_A + \rho_B$ is the density. Now if we multiply it with the left hand side it will be ρV_x is equal to $\rho_A V_{Ax} + \rho_B V_{Bx}$. So, now, ρV_x would be equal to if we substitute ρ_A with the molecular weight and the concentration it is $M_A C_A V_{Ax} + M_B C_B V_{Bx}$. So, it will be $M_A N_A + M_B N_B$ the N_A or N_B is the molar flux of component A and B.

(Refer Slide Time: 20:25)

Unsteady State Diffusion

$$\frac{\partial(M_A N_A + M_B N_B)}{\partial x} = \rho \frac{\partial V_x}{\partial x} + V_x \frac{\partial \rho}{\partial x} \quad \text{d}$$

Substituting equation (d) into equation (c)

$$\rho \left(\frac{\partial V_x}{\partial x} + \frac{\partial V_y}{\partial y} + \frac{\partial V_z}{\partial z} \right) + V_x \frac{\partial \rho}{\partial x} + V_y \frac{\partial \rho}{\partial y} + V_z \frac{\partial \rho}{\partial z} + \frac{d\rho}{dt} = 0 \quad \text{e}$$

This is the equation of continuity or a mass balance for a total substance.

If the solution density is constant from equation (e)

$$\frac{\partial V_x}{\partial x} + \frac{\partial V_y}{\partial y} + \frac{\partial V_z}{\partial z} = 0 \quad \text{f}$$

Now, from the earlier equations we can write $\frac{\partial}{\partial x}(M_A N_A + M_B N_B) + \frac{\partial}{\partial y}(M_A N_A + M_B N_B) + \frac{\partial}{\partial z}(M_A N_A + M_B N_B) = \rho \frac{\partial V_x}{\partial x} + V_x \frac{\partial \rho}{\partial x} + \rho \frac{\partial V_y}{\partial y} + V_y \frac{\partial \rho}{\partial y} + \rho \frac{\partial V_z}{\partial z} + V_z \frac{\partial \rho}{\partial z} + \frac{d\rho}{dt}$ would be equal to $\rho \frac{\partial V_x}{\partial x} + V_x \frac{\partial \rho}{\partial x} + \rho \frac{\partial V_y}{\partial y} + V_y \frac{\partial \rho}{\partial y} + \rho \frac{\partial V_z}{\partial z} + V_z \frac{\partial \rho}{\partial z} + \frac{d\rho}{dt}$. Substituting this equation d into the equation c we obtain the following relations. This is the equation of continuity or a mass balance for a total substance. If the solution density is constant from equation e we can write the $\rho \frac{\partial V_x}{\partial x} + \rho \frac{\partial V_y}{\partial y} + \rho \frac{\partial V_z}{\partial z} = 0$. And then from there we can write $\frac{\partial V_x}{\partial x} + \frac{\partial V_y}{\partial y} + \frac{\partial V_z}{\partial z} = 0$.

(Refer Slide Time: 21:33)

Unsteady State Diffusion

We know that in terms of mass flux & in the x- direction:

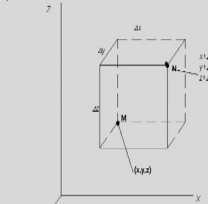

$$N_{A,x} = N x_A + J_{A,x}$$

$$M_A N_{A,x} = M_A N x_A + M_A J_{A,x}$$

$$\Rightarrow M_A N_{A,x} = M_A C V_x \frac{C_A}{C} + M_A J_{A,x}$$

$$\Rightarrow M_A N_{A,x} = \rho_A V_x + M_A J_{A,x}$$

$$\Rightarrow \frac{M_A \partial N_{A,x}}{\partial x} = V_x \frac{\partial \rho_A}{\partial x} + \rho_A \frac{\partial V_x}{\partial x} + M_A \frac{\partial J_{A,x}}{\partial x}$$

$$= V_x \frac{\partial \rho_A}{\partial x} + \rho_A \frac{\partial V_x}{\partial x} - M_A D_{AB} \frac{\partial^2 C_A}{\partial x^2}$$

We know that in terms of mass flux and in the x direction $N_{A,x}$ is equal to $N x_A$ plus $J_{A,x}$. Now, if we multiply both sides with the molecular weight of the components it is $M_A N_{A,x}$ is equal to $M_A N x_A$ plus $M_A J_{A,x}$. So, from there we can write $M_A N_{A,x}$ would be equal to $M_A C V_x \frac{C_A}{C}$ plus $M_A J_{A,x}$. So, if we rearrange $M_A N_{A,x}$ would be equal to $\rho_A V_x$ plus $M_A J_{A,x}$.

And hence if we differentiate this equations it would be $M_A \frac{\partial N_{A,x}}{\partial x}$ plus $V_x \frac{\partial \rho_A}{\partial x}$ plus $\rho_A \frac{\partial V_x}{\partial x}$ plus $M_A \frac{\partial J_{A,x}}{\partial x}$. Now, if we substitute in place of $J_{A,x}$ which is minus $D_{AB} \frac{\partial^2 C_A}{\partial x^2}$. Then this relations would be equal to $V_x \frac{\partial \rho_A}{\partial x}$ plus $\rho_A \frac{\partial V_x}{\partial x}$ minus $M_A D_{AB} \frac{\partial^2 C_A}{\partial x^2}$.

(Refer Slide Time: 23:15)

Unsteady State Diffusion

$$M_A \left(\frac{\partial N_{A,x}}{\partial x} + \frac{\partial N_{A,y}}{\partial y} + \frac{\partial N_{A,z}}{\partial z} \right) + \frac{\partial \rho_A}{\partial t} = M_A R_A \quad \text{a}$$

Eq. (a) then becomes,

$$V_x \frac{\partial \rho_A}{\partial x} + V_y \frac{\partial \rho_A}{\partial y} + V_z \frac{\partial \rho_A}{\partial z} + \rho_A \left(\frac{\partial v_x}{\partial x} + \frac{\partial v_y}{\partial y} + \frac{\partial v_z}{\partial z} \right) - M_A D_{AB} \left(\frac{\partial^2 C_A}{\partial x^2} + \frac{\partial^2 C_A}{\partial y^2} + \frac{\partial^2 C_A}{\partial z^2} \right) + \frac{\partial \rho_A}{\partial t} = M_A R_A \quad \text{g}$$

When $\rho = \text{constant}$, using equation (f) and dividing M_A in equation (g), we have

$$\frac{\partial v_x}{\partial x} + \frac{\partial v_y}{\partial y} + \frac{\partial v_z}{\partial z} = 0$$

$$V_x \frac{\partial C_A}{\partial x} + V_y \frac{\partial C_A}{\partial y} + V_z \frac{\partial C_A}{\partial z} + \frac{\partial C_A}{\partial t} = D_{AB} \left(\frac{\partial^2 C_A}{\partial x^2} + \frac{\partial^2 C_A}{\partial y^2} + \frac{\partial^2 C_A}{\partial z^2} \right) + R_A \quad \text{h}$$

From there we can write the equations for component a $M_A \frac{\partial N_{A,x}}{\partial x} + \frac{\partial N_{A,y}}{\partial y} + \frac{\partial N_{A,z}}{\partial z} + \frac{\partial \rho_A}{\partial t} = M_A R_A$, this is equation 1. This equation will reduce to this equation $V_x \frac{\partial \rho_A}{\partial x} + V_y \frac{\partial \rho_A}{\partial y} + V_z \frac{\partial \rho_A}{\partial z} + \rho_A \left(\frac{\partial v_x}{\partial x} + \frac{\partial v_y}{\partial y} + \frac{\partial v_z}{\partial z} \right) - M_A D_{AB} \left(\frac{\partial^2 C_A}{\partial x^2} + \frac{\partial^2 C_A}{\partial y^2} + \frac{\partial^2 C_A}{\partial z^2} \right) + \frac{\partial \rho_A}{\partial t} = M_A R_A$.

Where ρ is constant and using equation f and dividing M_A in equation g we obtain what is the equation f that is $\frac{\partial v_x}{\partial x} + \frac{\partial v_y}{\partial y} + \frac{\partial v_z}{\partial z} = 0$. So, if we substitute over here this would be equal to 0. And we will obtain $V_x \frac{\partial C_A}{\partial x} + V_y \frac{\partial C_A}{\partial y} + V_z \frac{\partial C_A}{\partial z} + \frac{\partial C_A}{\partial t} = D_{AB} \left(\frac{\partial^2 C_A}{\partial x^2} + \frac{\partial^2 C_A}{\partial y^2} + \frac{\partial^2 C_A}{\partial z^2} \right) + R_A$.

(Refer Slide Time: 25:11)

Unsteady State Diffusion

In the special case, where velocity equals to zero & there is no chemical reaction, from equation (h):

$$\frac{\partial c_A}{\partial \theta} = D_{AB} \left(\frac{\partial^2 c_A}{\partial x^2} + \frac{\partial^2 c_A}{\partial y^2} + \frac{\partial^2 c_A}{\partial z^2} \right)$$

$t = \theta$

This is Fick's second law.

This is frequently applicable to diffusion in solids and to limited situation in fluid.

In the special case where velocity equals to 0 and there is no chemical reactions from equation h we can write $\frac{\partial C_A}{\partial \theta}$ would be equal to $D_{AB} \left(\frac{\partial^2 C_A}{\partial x^2} + \frac{\partial^2 C_A}{\partial y^2} + \frac{\partial^2 C_A}{\partial z^2} \right)$, here t is equal to θ . So, this equation is known as the Fick's second law equation and this is frequently applicable to diffusion in solids and to limited situations in fluid.

So thank you for listening this lecture and we will discuss in the next lecture on the different applications of diffusion mass transfer.

Thank you.
